A separate answer sheet for Part I has been provided to you. Follow the instructions from the proctor for completing the student information on your answer sheet.

This examination has four parts, with a total of 37 questions. You must answer all questions in this examination. Record your answers to the Part I multiple-choice questions on the separate answer sheet. Write your answers to the questions in Parts II, III, and IV directly in this booklet. All work should be written in pen, except graphs and drawings, which should be done in pencil. Clearly indicate the necessary steps, including appropriate formula substitutions, diagrams, graphs, charts, etc. Utilize the information provided for each question to determine your answer. Note that diagrams are not necessarily drawn to scale.

The formulas that you may need to answer some questions in this examination are found at the end of the examination. This sheet is perforated so you may remove it from this booklet.

Scrap paper is not permitted for any part of this examination, but you may use the blank spaces in this booklet as scrap paper. A perforated sheet of scrap graph paper is provided at the end of this booklet for any question for which graphing may be helpful but is not required. You may remove this sheet from this booklet. Any work done on this sheet of scrap graph paper will *not* be scored.

When you have completed the examination, you must sign the statement printed at the end of the answer sheet, indicating that you had no unlawful knowledge of the questions or answers prior to the examination and that you have neither given nor received assistance in answering any of the questions during the examination. Your answer sheet cannot be accepted if you fail to sign this declaration.

37 Drugs break down in the human body at different rates and therefore must be prescribed by doctors carefully to prevent complications, such as overdosing. The breakdown of a drug is represented by the function $N(t) = N_0(e)^{-rt}$, where $N(t)$ is the amount left in the body, N_0 is the initial dosage, r is the decay rate, and t is time in hours. Patient A, $A(t)$, is given 800 milligrams of a drug with a decay rate of 0.347. Patient B, $B(t)$, is given 400 milligrams of another drug with a decay rate of 0.231.

Write two functions, $A(t)$ and $B(t)$, to represent the breakdown of the respective drug given to each patient.

$$A(t) = 800e^{-.347t} \qquad B(t) = 400e^{-.231t}$$

Graph each function on the set of axes below.

To the *nearest hour*, t , when does the amount of the given drug remaining in patient B begin to exceed the amount of the given drug remaining in patient A ?

- 10 A game spinner is divided into 6 equally sized regions, as shown in the diagram below.

36 Charlie's Automotive Dealership is considering implementing a new check-in procedure for customers who are bringing their vehicles for routine maintenance. The dealership will launch the procedure if 50% or more of the customers give the new procedure a favorable rating when compared to the current procedure. The dealership devises a simulation based on the minimal requirement that 50% of the customers prefer the new procedure. Each dot on the graph below represents the proportion of the customers who preferred the new check-in procedure, each of sample size 40, simulated 100 times.

Assume the set of data is approximately normal and the dealership wants to be 95% confident of its results. Determine an interval containing the plausible sample values for which the dealership will launch the new procedure. Round your answer to the *nearest hundredth*.

$$.506 \pm 2(.078)$$

$$0.35 - 0.66$$

Forty customers are selected randomly to undergo the new check-in procedure and the proportion of customers who prefer the new procedure is 32.5%. The dealership decides *not* to implement the new check-in procedure based on the results of the study. Use statistical evidence to explain this decision.

The 32.5% value falls below the 95% confidence level

37 A radioactive substance has a mass of 140 g at 3 p.m. and 100 g at 8 p.m. Write an equation in the form $A = A_0 \left(\frac{1}{2}\right)^{\frac{t}{h}}$ that models this situation, where h is the constant representing the number of hours in the half-life, A_0 is the initial mass, and A is the mass t hours after 3 p.m.

$$100 = 140 \left(\frac{1}{2}\right)^{5/h}$$

Using this equation, solve for h , to the nearest ten thousandth.

$$\log \frac{100}{140} = \log \frac{1}{2}^{5/h}$$

$$\log \frac{5}{7} = \frac{5}{h} \log \frac{1}{2}$$

$$h = \frac{5 \log \frac{1}{2}}{\log \frac{5}{7}} \approx 10.3002$$

Determine when the mass of the radioactive substance will be 40 g. Round your answer to the nearest tenth of an hour.

$$40 = 140 \left(\frac{1}{2}\right)^{\frac{t}{10.3002}}$$

$$\log \frac{2}{7} = \log \left(\frac{1}{2}\right)^{t/10.3002}$$

$$10.3002 \log \frac{2}{7} = t$$

$$\frac{10.3002 \log \frac{2}{7}}{\log \frac{1}{2}}$$

$$\approx 18.6$$

- 31 The Wells family is looking to purchase a home in a suburb of Rochester with a 30-year mortgage that has an annual interest rate of 3.6%. The house the family wants to purchase is \$152,500 and they will make a \$15,250 down payment and borrow the remainder. Use the formula below to determine their monthly payment, to the *nearest dollar*.

$$M = \frac{P\left(\frac{r}{12}\right)\left(1 + \frac{r}{12}\right)^n}{\left(1 + \frac{r}{12}\right)^n - 1}$$

M = monthly payment

P = amount borrowed

r = annual interest rate

n = total number of monthly payments

$$M = \frac{(152,500 - 15,250) \left(\frac{.036}{12}\right) \left(1 + \frac{.036}{12}\right)^{360}}{\left(1 + \frac{.036}{12}\right)^{360} - 1} \approx 624$$

34 Joseph was curious to determine if scent improves memory. A test was created where better memory is indicated by higher test scores. A controlled experiment was performed where one group was given the test on scented paper and the other group was given the test on unscented paper. The summary statistics from the experiment are given below.

| | Scented Paper | Unscented Paper |
|-----------|---------------|-----------------|
| \bar{x} | 23 | 18 |
| s_x | 2.898 | 2.408 |

Calculate the difference in means in the experimental test grades (scented – unscented).

$$23 - 18 = 5$$

A simulation was conducted in which the subjects' scores were rerandomized into two groups 1000 times. The differences of the group means were calculated each time. The results are shown below.

Question 34 is continued on the next page.

Question 34 continued

Use the simulation results to determine the interval representing the middle 95% of the difference in means, to the *nearest hundredth*.

$$\bar{x} \pm 2\sigma$$
$$-3.07 - 3.13$$

Is the difference in means in Joseph's experiment statistically significant based on the simulation? Explain.

Yes, a difference of 5 or more occurred 3 times out of 1000, which is statistically significant.

35 Carla wants to start a college fund for her daughter Lila. She puts \$63,000 into an account that grows at a rate of 2.55% per year, compounded monthly. Write a function, $C(t)$, that represents the amount of money in the account t years after the account is opened, given that no more money is deposited into or withdrawn from the account.

$$C(t) = 63000 \left(1 + \frac{.0255}{12}\right)^{12t}$$

Calculate algebraically the number of years it will take for the account to reach \$100,000, to the nearest hundredth of a year.

$$100000 = 63000 (1.002125)^{12t}$$

$$\log \frac{100}{63} = 12t \log(1.002125)^{12t}$$

$$\log \frac{100}{63} = t$$

$$\frac{\log \frac{100}{63}}{12 \log(1.002125)}$$

37 Website popularity ratings are often determined using models that incorporate the number of visits per week a website receives. One model for ranking websites is $P(x) = \log(x - 4)$, where x is the number of visits per week in thousands and $P(x)$ is the website's popularity rating. According to this model, if a website is visited 16,000 times in one week, what is its popularity rating, rounded to the nearest tenth?

$$P(16) = \log(16 - 4) \approx 1.1$$

Graph $y = P(x)$ on the axes below.

An alternative rating model is represented by $R(x) = \frac{1}{2}x - 6$, where x is the number of visits per week in thousands. Graph $R(x)$ on the same set of axes. For what number of weekly visits will the two models provide the same rating?

14,000
